$a = 7$

$b = 3$

Return 10.

Function Description

Complete the $solveMeFirst$ function with the following parameters:

- $int\ a$: the first value
- $int\ b$: the second value

Returns

- int: the sum of a and b

Constraints

$1 \leq a, b \leq 1000$

Sample Input

```
a = 2
b = 3
```

Sample Output

```
5
```

Change Theme Language Python 3

```python

def solveMeFirst(a, b):
    return a + b

if __name__ == "__main__":
    a = int(input().strip())
    b = int(input().strip())
    print(solveMeFirst(a, b))
```

You have earned 1.00 point!

You are now 29 points away from the 1st star for your problem solving badge.

Given an array of integers, find the sum of its elements.

For example, if the array $ar = [1, 2, 3]$, $1 + 2 + 3 = 6$, so return 6.

Function Description

Complete the $simpleArraySum$ function with the following parameter(s):

- $ar[n]$: an array of integers

Returns

- int: the sum of the array elements

Input Format

The first line contains an integer, n, denoting the size of the array.

The second line contains n space-separated integers representing the array's elements.

Constraints

$0 < n, ar[i] \leq 1000$

Sample Input

```
STDIN        Function
-----        --------
6           ar[] size n = 6
1 2 3 4 10 11  ar = [1, 2, 3, 4, 10, 11]
```

Sample Output

```
31
```

Change Theme Language Python 3

```python
def simpleArraySum(ar):
    return sum(ar)

if __name__ == "__main__":
    n = int(input().strip())                # size of array
    ar = list(map(int, input().strip().split()))  # array elements
    print(simpleArraySum(ar))

```

Alice and Bob each created one problem for HackerRank. A reviewer rates the two challenges, awarding points on a scale from 1 to 100 for three categories: problem clarity, originality, and difficulty.

The rating for Alice's challenge is the triplet a = (a[0], a[1], a[2]), and the rating for Bob's challenge is the triplet b = (b[0], b[1], b[2]).

The task is to calculate their comparison points by comparing each category:

- If a[i] > b[i], then Alice is awarded 1 point.
- If a[i] < b[i], then Bob is awarded 1 point.
- If a[i] = b[i], then neither person receives a point.

Example

a = [1, 2, 3]

b = [3, 2, 1]

- For elements *0*, Bob is awarded a point because a[0] < b[0].
- For the equal elements a[1] and b[1], no points are earned.
- Finally, for elements 2, a[2] > b[2] so Alice receives a point.

The return array is [1, 1] with Alice's score first and Bob's second.

Function Description

Complete the function compareTriplets with the following parameter(s):

- int a[3]: Alice's challenge rating
- int b[3]: Bob's challenge rating

Returns

- int[2]: the first element is Alice's score and the second is Bob's score

Input Format

The first line contains 3 space-separated integers, a[0], a[1], and a[2], the respective values in triplet a.

The second line contains 3 space-separated integers, b[0], b[1], and b[2], the respective values in triplet b.

Constraints

- 1 ≤ a[i] ≤ 100
- 1 ≤ b[i] ≤ 100

Sample Input 0

```
5 6 7
3 6 10
```

Sample Output 0

```
1 1
```

Change Theme Language Python 3

```python
def compareTriplets(a, b):
    alice_score = 0
    bob_score = 0

    for i in range(3):
        if a[i] > b[i]:
            alice_score += 1
        elif a[i] < b[i]:
            bob_score += 1

    return [alice_score, bob_score]

if __name__ == "__main__":
    a = list(map(int, input().strip().split()))
    b = list(map(int, input().strip().split()))

    result = compareTriplets(a, b)
    print(result[0], result[1])
```

In this challenge, you need to calculate and print the sum of elements in an array, considering that some integers may be very large.

Function Description

Complete the $aVeryBigSum$ function with the following parameter(s):

- $int\ ar[n]$: an array of integers

Return

- $long$: the sum of the array elements

Input Format

The first line of the input consists of an integer n.

The next line contains n space-separated integers contained in the array.

Output Format

Return the integer sum of the elements in the array.

Constraints

$1 \leq n \leq 10$

$0 \leq ar[i] \leq 10^{10}$

Sample Input

```
STDIN                                        Function
-----                                        --------
5                                           arr[] size n = 5
1000000001 1000000002 1000000003 1000000004 1000000005  arr[...]
```

Output

```
5000000015
```

Change Theme Language Python 3

```python
def aVeryBigSum(ar):
    total = 0
    for num in ar:
        total += num
    return total

if __name__ == "__main__":
    n = int(input().strip())                        # number of elements
    ar = list(map(int, input().strip().split()))  # array elements
    print(aVeryBigSum(ar))
```
